

PRODUCT MANAGEMENT PRACTICES IN PERSONAL LENDING

An Interview-Based Analysis of Poonawalla Fincorp

INDUSTRY INTERVIEW
REPORT

Interviewee	Mr. Gaurav Banani, Product Manager, Personal Loans, Poonawalla Fincorp
Submitted by	Learning Team 3 1. Dhananjay Singh – 25PGDM017 2. Kartikey Gaur – 25PGDM023 3. Shivam Kumar – 25PGDM044 4. Abhiroop Banerjee – 25PGDM116 5. Yash Arora – 25PGDM051
Submitted to	Dr. Karan Grover
Institution	Fortune Institute of International Business, New Delhi
Academic Year	2026-27

Prepared as part of the Team Project: Product Management Mini-Portfolio

01 Report Navigation

This report separates recorded interview evidence from Learning Team 3's analysis so that every conclusion remains traceable and academically defensible.

Section	Page
Executive Summary, Objectives and Methodology	3
Product and Product-Manager Context	4
Opportunity, Customer Segment and Value Proposition	5
Product Lifecycle and Design Coherence	6
Pricing, Commercial Logic and Go-to-Market	7
Risk, Product-Market Fit and Product Discontinuation	8
Integration with PMGI Course Frameworks	9
Proposed Roadmap and Prioritisation	10
Metric Tree, Experiments and Risk Controls	11
Managerial Recommendations, Learnings and Conclusion	12
AI Usage Declaration and Interview Evidence	13

Assessment Alignment

Evaluation Area	Where Addressed
Problem framing and sizing	Sections 3 and 4
Product design coherence	Section 5
PMF reasoning	Section 7
GTM realism	Section 6
Roadmap and metric soundness	Sections 9 and 10
Original managerial judgement	Section 11

EVIDENCE CONVENTION Blue callouts summarise what the interviewee stated. Gold callouts present Learning Team 3's interpretation, proposed frameworks or recommendations. No new interview answer has been created or attributed to the interviewee.

02 Executive Summary

This report analyses product-management practices in the personal-loan business through a recorded interaction with Mr. Gaurav Banani, Product Manager at Poonawalla Fincorp. The discussion provided a particularly useful view of product management in a regulated financial-services setting, where the role is distributed across specialists responsible for policy, systems, customer journeys, portfolio economics and channel performance.

Mr. Banani's present responsibilities are concentrated on budgeting and P&L monitoring, annual business and profit targets, channel-partner payouts and sales-incentive structures. This makes the interview less a conventional software-product story and more an examination of how a mature lending product is managed after launch. The central managerial theme is that growth cannot be separated from the economics and ageing behaviour of the loan book.

The interview identifies three foundations of the personal-loan proposition: a large and growing market, a clearly preferred salaried customer segment, and a debt-consolidation benefit that can reduce the customer's monthly EMI through a single longer-tenure loan. It also explains the commercial logic of pricing through cost of funds, operating costs, required margin and competitor benchmarks. Product success is judged not only by early profitability but by delinquency, provisioning and portfolio performance as the book matures.

Learning Team 3 has linked these insights to the PMGI frameworks of TAM-SAM-SOM, Stage-Gate, product-market fit, MoSCoW prioritisation, outcome roadmapping, North Star/AARRR metrics, experimentation and GTM planning. Wherever the transcript did not contain a specific current launch example, this report presents a clearly labelled team recommendation rather than treating it as interview evidence.

Project Objectives and Methodology

Element	Approach Used
Primary objective	Understand how a financial-services product team identifies opportunity, designs and operates a product, balances growth with risk, measures success and responds to regulation.
Method	Semi-structured recorded interview followed by qualitative thematic analysis and linkage with course frameworks.
Primary evidence	Interview transcript and Google Meet screen capture supplied by the team.
Unit of analysis	Personal-loan product management, with emphasis on portfolio economics and channel management.
Analytical approach	Evidence extraction -> framework mapping -> gap identification -> managerial recommendations.

SCOPE BOUNDARY The interviewee explained that system development, policy design and customer testing are handled by other product specialists. Therefore, the report treats his comments on those areas as an informed description of the wider team process, while the deepest direct evidence relates to budgeting, profitability, channel payouts and portfolio monitoring.

03 Product and Product-Manager Context

The product under study is the personal-loan portfolio of Poonawalla Fincorp. In the interview, Mr. Banani described a mature product environment rather than a greenfield launch. His role sits close to the commercial control centre of the portfolio: translating approved budgets into business targets, monitoring expected profitability, managing channel economics and supporting sales execution.

INTERVIEW EVIDENCE Mr. Banani stated that his day-to-day remit includes strategic budgeting, P&L monitoring, annual business and profit targets, channel-partner payouts and the incentive structure for the sales department.

Role Map

Responsibility	What It Involves	PM Interpretation
Budget and P&L	Translate approved departmental budgets into operating targets; monitor whether the portfolio is progressing toward planned profitability.	Business viability and resource discipline
Business targets	Connect manpower and channel capacity with the annual amount of business expected from the department.	Outcome ownership
Channel payouts	Define or monitor the economic terms paid to sourcing partners.	Acquisition economics
Sales incentives	Shape incentives intended to align the sales force with business objectives.	Execution and behaviour design
Cross-functional coordination	Work within a broader team that includes policy, systems, operations, credit and servicing specialists.	End-to-end product governance

Stakeholder System in Lending Product Management

Stakeholder	Contribution to the Product
Sales and channel partners	Customer acquisition, lead quality, conversion and field feedback
Credit and risk	Eligibility rules, underwriting, fraud controls and portfolio quality
Operations	Document processing, disbursal and service execution
Technology	LOS/LMS, integrations, digital journey and automation
Finance and leadership	Budget approval, cost of funds, profitability and capital allocation
Compliance and regulation	Permissible product structures, disclosures and process controls

LEARNING TEAM 3 ANALYSIS The interview shows why a lending PM cannot be evaluated only by feature delivery. The role connects customer value, revenue, cost of capital, distribution behaviour, credit quality and regulatory compliance. Product ownership is therefore distributed, but the product outcome remains shared.

04 Opportunity, Customer Segment and Value Proposition

Mr. Banani framed the personal-loan opportunity through the size and growth of the wider credit market. He estimated the Indian lending market at approximately Rs 297 lakh crore, retail lending at about Rs 156 lakh crore and active personal loans at around Rs 16 lakh crore, with annual growth of roughly 15-20 percent. These figures are treated as interview estimates rather than independently verified market data.

TAM-SAM-SOM Interpretation

Layer	Application to the Interview	Managerial Meaning
TAM	The broad personal-loan market described in the interview: approximately Rs 16 lakh crore of active personal loans.	Shows category attractiveness and the scale of unmet or recurring credit demand.
SAM	Customers who meet the lender's risk and policy criteria, especially salaried employees in large private, public-sector and government organisations.	Narrows the market to an addressable risk profile and stable-income segment.
SOM	The share realistically reachable through approved budgets, branches, digital journeys, corporate relationships and channel partners.	No numeric SOM was provided; it should be tied to capacity, risk appetite and unit economics.

Beachhead Segment and Customer Job

The preferred beachhead segment described in the interview is salaried customers employed by strong corporate or government organisations. This is strategically coherent because stable income and verifiable employment can reduce underwriting uncertainty while supporting digital decisioning.

CUSTOMER JOB-TO-BE-DONE “Help me combine multiple loan obligations into one manageable monthly payment, without a slow or confusing process, while giving me a clear path for future servicing.”

Value Proposition

Value Dimension	Customer Benefit
Functional value	Debt consolidation: replace several personal-loan EMIs with one loan and one monthly payment.
Financial value	Potentially lower the monthly EMI through a longer tenure and a sustainable rate.
Convenience value	A faster, simpler and increasingly automated application-to-disbursal journey.
Service value	Defined processes for closure, top-up and other post-disbursal needs.
Trust requirement	Transparent communication on eligibility, rejection, tenure, total repayment and fees.

MANAGERIAL IMPLICATION A lower EMI is meaningful, but a longer tenure may increase the total amount repaid. The proposition should therefore be positioned as transparent debt management, not merely as an “instant loan” or a smaller monthly number.

05 Product Lifecycle and Design Coherence

Although Mr. Banani did not personally own a current new-product launch, he described the sequence followed by the wider product team. The sequence closely resembles a Stage-Gate process: investigate the market, establish feasibility, secure approval, build the operating system and policies, launch through selected channels, and then manage servicing and portfolio performance.

Stage-Gate Mapping

Stage	Interview-Derived Activity	Gate Question
1. Discover	Market and competitor study; identify customer problems and category opportunity.	Is the problem important and is the category attractive?
2. Define	Select target customer, value proposition and broad product structure.	For whom are we solving what problem?
3. Business case	Budgeting, capability review, profitability logic and leadership presentation.	Can the organisation fund and sustain the proposition?
4. Build	Develop LOS/LMS journey, policy, process and software integrations.	Can the proposition be delivered safely and conveniently?
5. Launch	Activate digital and partner channels; communicate product and pricing.	Can qualified customers be acquired and converted efficiently?
6. Learn and manage	Monitor servicing, portfolio behaviour, profitability, delinquency and market presence.	Is the book creating durable customer and business value?

End-to-End Customer Journey

Journey Stage	Product Responsibility	Customer Outcome
Awareness and consideration	Segment-specific communication, partner sourcing and debt-consolidation education	Relevance and trust
Application and KYC	Digital form, document capture and basic eligibility checks	Low effort and clarity
Underwriting	Credit bureau and fraud checks, policy rules and manual review where needed	Fast but responsible decision
Disbursal	Clear sanction terms, acceptance and transfer of funds	Certainty and transparency
Repayment and service	EMI management, closure, top-up and issue resolution	Long-term relationship quality

INTERVIEW EVIDENCE The interview emphasised that the journey should be efficient, simple and increasingly automated, while the organisation must also communicate an early rejection clearly and provide convenient post-disbursal servicing.

DESIGN ASSESSMENT The design is coherent when the front-end promise of speed is supported by reliable underwriting, transparent terms and a serviceable back end. A fast application that creates later confusion, weak credit quality or poor service would be a local optimisation rather than a successful product.

06 Pricing, Commercial Logic and Go-to-Market

Pricing emerged as one of the strongest areas of the interview because it connects product attractiveness with sustainability. Mr. Banani explained that a lender must account for the cost of funds, operating and servicing costs, the required margin, competitor rates and the quality of customers likely to accept a given price.

Illustrative arithmetic from the interview; it is not presented as Poonawalla Fincorp's actual pricing or margin.

Commercial Decision Principles

- A price must cover funding and operating costs while leaving an acceptable risk-adjusted contribution.
- Competitor pricing sets a reference point; a materially higher rate can weaken conversion and may attract a riskier customer mix.
- Channel payouts and sales incentives must reward quality business, not only disbursal volume.
- Profitability should be assessed after expected credit costs and servicing costs, not only through the nominal interest spread.

GTM Assessment and Proposed Rollout

GTM Choice	Recommended Direction	Reason
Target	Salaried customers with stable employment and multiple existing obligations	Clear beachhead and manageable underwriting profile
Positioning	One manageable EMI, transparent consolidation and convenient servicing	More defensible than generic “quick cash” messaging
Channels	Direct digital, channel partners, selected corporate or employer relationships	Combines convenience with distribution reach
Rollout	Pilot by channel or employer cohort; scale after conversion, credit-quality and profitability thresholds	Protects against premature national scaling
Communication	Explain eligibility, rate, tenure, total repayment, fees and rejection outcomes	Supports informed borrowing and trust

LEARNING TEAM 3 RECOMMENDATION Treat every channel as a measurable product surface. Compare lead quality, approval-to-disbursal conversion, acquisition cost, early delinquency and risk-adjusted contribution by channel before increasing payouts or budget.

07 Risk, Product-Market Fit and Product Discontinuation

Balancing Speed with Responsible Lending

The interview recognises a central tension in digital lending: customers value fast approval and a low-friction journey, but reducing friction can increase exposure to fraud, weak documentation and unsuitable borrowing. Mr. Banani referred to credit-bureau data, system integrations and fraud-detection tools as controls, while acknowledging that no control removes all risk.

Design Objective	Required Product Behaviour
Customer convenience	Short forms, fewer repetitive documents, quick decisions, clear status communication
Credit responsibility	Eligibility rules, bureau history, income/obligation assessment and policy checks
Fraud control	Data integrations, duplicate or suspicious application checks and exception review
Privacy and trust	Purpose-limited data collection, secure processing and transparent consent
Business guardrail	No growth target should override portfolio-quality or compliance thresholds

Product-Market Fit in Lending

Mr. Banani identified profitability, book behaviour and market presence as the three main indicators of product success. His most important observation was that success cannot be declared immediately after launch. A loan book needs time to season before the organisation can see delinquency, provisioning and loss behaviour.

INTERVIEW INSIGHT A lending product may look profitable in its first year, but durable product-market fit is visible only when the book matures and customer repayment behaviour remains healthy.

PMF Dimension	Evidence Required
Customer value	Qualified customers complete the journey, understand the terms and experience a manageable repayment outcome.
Adoption	The target segment applies, converts and uses the product through efficient channels.
Economics	Contribution remains positive after acquisition, servicing and expected credit costs.
Portfolio quality	Delinquency, NPA and provisioning remain within approved risk appetite as cohorts mature.
Defensibility	The product gains a sustainable position without relying on uneconomic pricing or incentives.

Modification and Discontinuation Logic

The interviewee stated that financial institutions generally prefer modifying a product over discontinuing it because launching a product requires significant initial investment. However, regulatory change can force redesign or withdrawal. A disciplined portfolio review should therefore distinguish between a fixable feature problem and a structural reason to exit.

Decision	Suggested Trigger
Modify	Customer friction, weak channel performance, fixable pricing, feature or servicing gaps
Scale down	Poor risk-adjusted economics in a segment or channel, but a viable core proposition remains
Discontinue	Regulatory prohibition, persistent negative unit economics, unacceptable book behaviour or no credible customer demand

08 Integration with PMGI Course Frameworks

The interview becomes managerially useful when the practitioner observations are translated into structured product decisions. The following synthesis links the transcript to the course learning outcomes on opportunity definition, discovery and prioritisation, roadmap and metrics, and GTM/growth decisions.

Framework	Evidence from Interview	Application / Gap
Stage-Gate / NPD	Market study -> budgeting -> approval -> LOS/LMS and policy build -> launch -> servicing	Provides a disciplined sequence; explicit gate criteria should be documented.
TAM-SAM-SOM	Large personal-loan category; salaried customers form the preferred addressable segment	SOM requires capacity, risk appetite and channel-level economics, not just market size.
Problem Find-Solve	Multiple EMIs and difficult servicing are identifiable customer problems	Validate the severity and frequency through customer interviews and journey analytics.
Beachhead and positioning	Stable salaried customers; debt consolidation and convenience	Position around transparent repayment management rather than speed alone.
PMF framework	Profitability, book behaviour and market presence	Add customer outcomes, cohort quality and repeat/referral signals.
MoSCoW / RICE	No prioritisation method was discussed directly	Use MoSCoW now; apply RICE only when reach, impact, confidence and effort data are available.
Outcome roadmap	Budget targets and portfolio monitoring are present, but a product roadmap was not detailed	Organise work around measurable outcomes rather than a list of features.
North Star / AARRR	Success metrics were portfolio-focused	Combine funnel metrics with risk-adjusted portfolio metrics.
GTM and launch	Target segment, pricing logic and channel partners were discussed	Add explicit pilot, communication, enablement and scaling gates.

Evaluation-Criteria Synthesis

Criterion	Assessment
Problem framing and sizing	Strong: category size, growth, segment and debt-consolidation need are clearly articulated.
Product design coherence	Moderate-to-strong: journey, policy, systems, risk and servicing are connected, although no specific current initiative was examined.
PMF reasoning	Strong lending-specific insight: profitability must survive seasoning, delinquency and provisioning.
GTM realism	Partial interview evidence; strengthened in this report through a controlled segment-and-channel rollout.
Roadmap and metric soundness	Not explicit in the interview; developed as Learning Team 3 proposals in Sections 9 and 10.

CRITICAL JUDGEMENT The transcript is strongest when treated as a portfolio-management interview. Its value lies in showing that a financial product is not “finished” at launch: the real test is whether the economics, customer outcomes and credit quality remain healthy over time.

09 Proposed Outcome Roadmap and Prioritisation

The following roadmap is a Learning Team 3 proposal based on the interview themes. It is not presented as Poonawalla Fincorp's internal plan. The roadmap converts the interview's emphasis on convenience, debt consolidation, risk and profitability into a sequenced set of outcomes.

Horizon	Outcome Theme	Indicative Initiatives	Success Direction
0-90 days	Instrument the current journey	Create a channel and funnel dashboard; define rejection reasons; track turnaround time; establish baseline delinquency and contribution by cohort.	Reliable baseline and visibility
3-6 months	Validate the consolidation proposition	Pilot an EMI-consolidation calculator and clear disclosure journey for selected salaried cohorts; compare direct and partner channels.	Higher qualified conversion without weakening risk
6-9 months	Improve service and retention	Strengthen self-service for statements, closure requests, top-up eligibility and issue tracking; analyse repeat service demand.	Lower service effort and stronger relationship quality
9-12 months	Scale risk-adjusted growth	Increase budget only for segments and channels that meet conversion, cost, delinquency and contribution thresholds.	Sustainable portfolio growth
Ongoing	Lifecycle and compliance governance	Quarterly product review; monitor regulation; review incentive design and kill criteria.	Faster response to portfolio or policy change

MoSCoW Prioritisation

Priority	Scope
Must have	Journey instrumentation; clear pricing and tenure disclosures; credit/fraud guardrails; channel-quality dashboard; post-disbursal service standards
Should have	Debt-consolidation calculator; employer/cohort pilots; personalised offer logic; channel incentives linked to portfolio quality
Could have	Referral programme for eligible customers; proactive repayment education; richer self-service insights
Will not do now	Uncontrolled "instant approval" with weaker risk controls; broad untargeted acquisition; national scaling before cohort evidence

WHY MOSCOW RATHER THAN A NUMERIC RICE SCORE? The transcript does not provide internal reach, effort or confidence estimates. Assigning precise RICE scores would create false accuracy. MoSCoW gives a defensible first prioritisation; RICE can be applied later using verified funnel, capacity and engineering data.

Roadmap Governance

- Each outcome should have one accountable owner and named partners across credit, sales, operations, technology and finance.
- Monthly reviews should examine leading indicators; quarterly reviews should include mature-cohort quality and risk-adjusted economics.
- Budget release should be linked to evidence gates rather than treated as a one-time annual commitment.

10 Metric Tree, Experiments and Risk Controls

Proposed North Star Metric

NORTH STAR Monthly risk-adjusted performing disbursements to the target segment: loans that are successfully disbursed, remain within early repayment-quality thresholds and generate positive expected contribution.

This metric is preferable to disbursement volume alone because it combines customer activation, portfolio quality and business viability. It should be reported alongside customer-protection guardrails so that growth does not come from unsuitable borrowing.

AARRR-Informed Metric Tree

Layer	Illustrative Metrics
Acquisition	Qualified applications by channel; cost per qualified lead; employer/partner cohort mix
Activation	Application completion; KYC completion; approval rate; approval-to-disbursement conversion; turnaround time
Retention	On-time EMI rate; 30+ DPD; service resolution; repeat/top-up eligibility and usage
Revenue	Yield; cost of funds; channel payout; operating cost; expected credit cost; risk-adjusted contribution
Referral / trust	Customer-reported clarity; complaint rate; referral leads; repeat engagement
Guardrails	Fraud rate; mis-selling complaints; policy exceptions; privacy incidents; regulatory breaches

Proposed Experiment Backlog

Hypothesis	Expected Effect	Test	Decision Metrics
Transparent consolidation calculator	Showing current EMIs, proposed EMI, tenure and total repayment improves qualified completion and reduces confusion.	A/B test calculator vs standard information page	Qualified completion; complaint rate; risk mix
Quality-linked channel incentive	Rewarding disbursements that remain healthy through an early performance window improves channel economics.	Pilot revised payout with selected partners	Risk-adjusted contribution; early delinquency; partner productivity
Simplified document journey	Removing duplicate document requests shortens turnaround without increasing fraud.	Journey cohort test with unchanged underwriting rules	TAT; completion; fraud and policy exceptions

Priority Risk Register

Risk	Probability	Impact	Primary Control
Credit deterioration	High	High	Cohort monitoring, policy cut-offs, early-warning triggers and risk-adjusted pricing
Fraud / identity manipulation	Medium	High	Data integrations, exception review, device/application checks and audit trail
Channel incentive distortion	Medium	High	Payouts linked to quality and reversals, not only disbursement volume
Margin compression	Medium	High	Track cost of funds, acquisition cost, servicing cost and competitor price movement
Regulatory change	Medium	High	Compliance watch, product inventory, rapid redesign and customer communication plan

11 Managerial Recommendations

1. Manage the portfolio through a risk-adjusted metric tree. Build one management view that connects acquisition, conversion, cost, margin, early delinquency, provisioning and mature-cohort performance. This would prevent volume or nominal spread from being treated as success in isolation.

2. Formalise a continuous customer-discovery cadence. Even in a mature product, interview customers, sales staff and service teams regularly. Focus on consolidation pain points, document friction, rejection clarity, repayment stress and post-disbursal needs.

3. Make debt consolidation transparent by design. Show the current combined EMI, proposed EMI, new tenure, total repayment, fees and savings or trade-offs. The customer should understand both the short-term relief and the full financial commitment.

4. Link channel payouts and incentives to quality. Reward partners for qualified applications and healthy early repayment behaviour, not just disbursal. This aligns growth, customer suitability and portfolio economics.

5. Use controlled pilots before scaling. Test major journey, pricing or channel changes in a defined segment. Scale only when conversion, customer clarity, fraud, credit quality and risk-adjusted contribution meet agreed thresholds.

6. Establish lifecycle review and kill criteria. Every quarter, decide whether a proposition should be improved, scaled down or stopped. Include regulation, customer demand, economics, book behaviour and operational complexity in the decision.

7. Build an outcome roadmap across functions. Assign shared outcomes to product, credit, operations, technology, sales and finance. This prevents hand-offs from weakening the end-to-end customer experience.

Key Managerial Learnings

- Product-management roles differ by industry and may be specialised even within one product team.
- A mature financial product requires continuous management after launch; the portfolio is the product as much as the digital journey is.
- In lending, PMF is delayed: book seasoning and repayment behaviour matter more than early revenue alone.
- Pricing, channel incentives and credit quality are product decisions because they shape who enters the portfolio and whether value is sustainable.
- Regulation is not an external afterthought; it is a lifecycle input that can reshape or end a proposition.

Conclusion

The interview demonstrates that product management in personal lending is an exercise in balancing customer convenience, growth, risk and economics over time. Poonawalla Fincorp's personal-loan context, as described by Mr. Banani, highlights a sizeable market, a focused salaried segment, a debt-consolidation value proposition and a digital service ambition. At the same time, the product cannot be judged through launch metrics alone; sustainable performance depends on the behaviour of the book, channel quality and regulatory alignment.

The strongest managerial recommendation is to connect the organisation's existing budgeting and portfolio discipline with a more explicit outcome roadmap, customer-discovery cadence, experiment backlog and risk-adjusted metric tree. That combination would preserve the interview's commercial realism while strengthening product design, GTM learning and long-term customer value.
